

A Constraint-First Framework for Stability Across Complex Systems

A White Paper for Independent Validation

Abstract

This white paper presents a constraint-first framework for analyzing stability across complex systems, developed through disciplined observation, review, and rectification. The framework introduces stability as entropy constrained by geometry and is submitted for independent validation and falsification.

1. Purpose of Submission

This document defines the methodological framework and validation boundaries.

[Placeholder: Institutional submission context, journal name, or lab identifier]

2. Scope and Non-Scope

Defines included domains and explicit exclusions to prevent overclaim.

[Placeholder: Reviewer-requested scope clarifications]

3. Methodology: Operational Reality Restraint (ORR)

ORR enforces a closed-loop discipline of Observation, Review, and Rectification.

[Placeholder: Diagram – ORR Loop Flowchart]

4. Campbell Control Baseline (CCB)

A falsification anchor designed to prevent meaning generation from noise.

[Placeholder: Baseline comparison table or chart]

5. Geo-Meta Stability Theory (GMST)

Conceptual framework defining stability as constrained entropy.

[Placeholder: Geometric constraint illustration]

6. Evidence Base

Longitudinal observation treated as structured data, not narrative authority.

[Placeholder: Data classification table]

7. Conceptual Constructs

Mathematical and structural constructs pending empirical derivation.

[Placeholder: Symbol legend and definitions]

8. Validation Ladder

Objective gates required for confirmation or falsification.

[Placeholder: Validation ladder schematic]

9. Ethical Constraints

Structural ethics treated as system-stability requirements.

[Placeholder: Ethics compliance checklist]

10. Conclusion

Framework completeness with validation pending.

[Placeholder: Reviewer summary comments]
