

"I didn't start with a theory. I just paid attention.
I noticed something important wasn't being measured, and nobody could tell me why.
At first I didn't even know what it was — I had to figure out how to define it before I could test it.
I still don't claim certainty about what it means. But it's measurable now.
And once something is measurable, it becomes tangible.
If it's tangible, it must have been real — even before we had words for it.
I didn't take 'no' for an answer because I knew what I was observing.
Science isn't genius. It's attention.
You observe, you ask why, and then you try to destroy your own explanations
until the only thing left standing is what reality actually touches."
